The net profit margin is net income divided by sales which is equal to 0.53, meaning that the business could retain 0.53 profit from each dollar of sales. The ratio could be considered healthy as the company is making relatively larger profit from each dollar of sales. In terms of its return on equity, the ratio is 11.5 percent, meaning that for every dollar of common shareholder equity, the company generates around 11.5 dollars of net income. It is recommended that the company may need more assets like expanding inventories or investing more to be more competitive. In terms of account receivable, the average collection period is 14.6 days, meaning that the firm is very efficient in collecting receivables. In short, the company is operating more on a cash basis. Its financial condition is considered healthy in terms of generating income and controlling the level of cost.
